FABRICATION SERVICES Project Highlight

Our Harvey, LA fabrication facility features 1,000 feet of waterfront property and a nearly 20,000 square foot fabrication shop.

PROJECT: Span Support Assembly Fabrication

WORK SCOPE: Supply labor, material and equipment to procure, fabricate, paint, assemble and test five subsea span supports for Chevron's Jack St. Malo Oil Export Pipeline.

All components of the span supports were prefabricated and preassembled. Testing was completed before it was disassembled and painted. Upon re-assembly, final tests were conducted, final painting was completed, and the span supports were loaded out for delivery.

- ▶ Testing included Load test, Factory Acceptance Testing (FAT) and Systems Integration Testing (SIT).
- ▶ Completed in a timely manner with Incident-Free Performance.

"The staff at Chet Morrison Contractors (CMC) did a good job organizing the work, and collaborated with us weekly to discuss and prepare for upcoming activities. The fabrication went smoothly and CMC was able to handle all of our last-minute fabrication needs without any issues while staying on schedule. We were very impressed with CMC's handling of our full scale FAT/SIT. The testing was quite extensive and involved scope outside of that which is typically performed by a fabrication shop. CMC provided the necessary resources and manpower to make the two-week long FAT/SIT a success and we look forward to working with the Harvey team again."
